

SHOPPAGE v1.1.1

National Launch Master Business Model — Liability-Controlled Preloaded Intelligence and Execution-Gate Edition

Date: 11 July 2026 | Status: Binding strategy, preloaded-intelligence doctrine, mandatory pre-gates and controlled-launch engineering blueprint | Supersedes: v1.1 FULL Amended | Classification: Board + Execution + Fundraise

Core decision (Non-Negotiable): Shoppage will not launch as an empty marketplace. It launches as a Zimbabwe-owned commerce operating system preloaded with a rights-governed national reference graph: 1M+ master-product identities, 10k+ claim-ready organisation and merchant profiles, national place scaffold, known markets and market-in-market structures, historical commerce evidence, cold-start recommendations. Merchant-specific price, stock, fulfilment and current operating claims remain time-bound local offer truth. Platform must remain fully operational with Facebook, WhatsApp, TikTok, Google and all external adapters disabled. Public launch clock does not start until four mandatory pre-gates pass with documentary evidence: source rights, field activation economics, native-demand superiority, independent security/privacy/rights review.

Document Control and v1.1.1 Binding Corrections

This edition retains v1.1 preloaded-launch doctrine and converts adversarial review into binding execution controls. v0.7 remains evidence compendium, v0.9 consolidated predecessor, v1.0 preloaded decision record, v1.1 FULL amended master. **v1.1.1 is current operating master.**

- 1. 12-week build begins only after four pre-mobilisation gates have documentary evidence.
- 2. Unclaimed profiles receive exact public copy, immediate suppression route, 24-hour action SLA.
- 3. Every source enters rights register before public indexing, AI use, or external claims. Default BLOCKED.
- 4. One-million master catalogue is Reference Library; default buyer search prioritises fresh local offers + Request Network.
- 5. Home, Power and Building receives separate launch taxonomy, 20k+ corpus, attribute schemas, compatibility graph.
- 6. Launch recommendations are deterministic/hybrid; learning-to-rank gated behind 5k resolved needs + 500-query eval.
- 7. Pemosites deferred beyond month 6, cannot consume launch engineering capacity.
- 8. Freshness enforced by auto-hide and ranking/ad eligibility, not reminders alone.
- 9. Facebook/WhatsApp/TikTok/Google are strong manual export + authorised-import adapters, not critical infra.
- 10. Pricing simplified to Free Foundation + \$19 Growth Pilot during willingness-to-pay measurement.
- 11. Verification badges predicate-specific and budgeted; 10k claim-ready ≠ field-verified.
- 12. Reference records and unclaimed profiles excluded from active-inventory, active-merchant, revenue KPIs in board reporting.

Binding interpretation rule: Where document uses must, will, non-negotiable = current product/governance decision. Where uses target, hypothesis, candidate, pilot, later = requires validation before binding.

Evidence and public-display ladder: Foundation validated → Preloaded reference → Sourced candidate → Corroborated profile → Merchant-claimed → Verified current claim → Production truth. Shoppage will not collapse states into one blanket verified badge. Directory entry, map point, Facebook page, model output verifies only predicate supported by its source and date.

1. Executive verdict and scope
2. Zimbabwe ground reality
3. Vision, mission and brand architecture
4. Shoppage system architecture

5. Shoppage Central
6. Shoppage Showcase
7. Shoppage Ads
8. Shoppage Creators
9. Shoppage Markets
10. Merchant sites and Pemosites
11. Commerce Intelligence Graph and Preloaded Launch Inventory
12. Defensibility and network effects
13. Daily utility and responsible habit formation
14. AI-native operating model
15. Trust, safety and consumer protection
16. Payments and transaction ownership
17. Fulfilment and last-mile delivery
18. Data governance, rights and compliance
19. Revenue model and pricing architecture
20. Competitive strategy and platform substitution
21. Shoppage Framework and ecosystem
22. Go-to-market and field operations
23. International quality and technical architecture
24. Months 0-3 controlled launch roadmap
25. Months 4-6 expansion roadmap
26. Metrics, economics and investor proof
27. Governance, organisation and decision rights
28. National impact readiness and institutional engagement
29. Risk register and decision gates
30. Final business model and immediate actions

Appendix A: prioritised 95-aim portfolio

Appendix B: strategic extension portfolio

Appendix C: core data entities and events

Appendix D: source and evidence notes

Appendix E: holistic review summary

Appendix F: mandatory pre-public-launch gates

Appendix G: source-rights register specification

Appendix H: unclaimed-profile policy and public copy

Appendix I: coverage-cell and native-demand test standard

Appendix J: independence kill-switch acceptance tests

Appendix K: creator-bounty operating procedure

Appendix L: v1.1.1 engineering backlog and kill list

PageBreak

1. Executive Verdict and Scope

1.1 What Shoppage is

Shoppage is a local commerce-intelligence, discovery, media and operating platform. Five internal product domains with reusable framework beneath. Domains organise teams, permissions, APIs, economics; they are not five separate consumer products users must learn. Public communication uses one Shoppage brand and three verbs: Sell, Discover, Grow.

Internal Domain	Primary Function	External Promise
Shoppage Central	Merchant OS, authoritative Merchant Site	Sell and maintain commercial truth
Shoppage Showcase	Search, geolocal discovery, requests, shoppage show what is available, nearby and credible	Discover what is available, nearby and credible
Shoppage Ads	Local commerce advertising and attribution	Grow through measurable local outcomes
Shoppage Creators	Content production, community distribution	Grow through trusted local voices
Shoppage Markets	Digital operating layer for malls, markets, cities	Sell and discover within real commercial places

1.2 What Shoppage is not (First 6 months)

• National fulfilment fleet • Deposit-taking wallet or unlicensed escrow • General entertainment social network • Unrestricted public plugin store • Unqualified claim every preloaded org is trading or every master product sold in Zim • Owner of every merchant transaction • Custom website agency disguised as software • Political advertising platform • Broad marketplace launching every category simultaneously.

1.3 Controlled-launch definition

Fully functional in months 0-3 means end-to-end flows work in controlled Harare wedge: merchant can discover/claim preloaded profile, resolve ownership, create Merchant Site, publish products, confirm price/stock; buyer can search preloaded master catalogue and national org/place graph, distinguish reference from current local offers, browse clips, compare, submit request, contact merchant; merchant can buy simple promotion and see attributable results; creator can complete contracted bounty while tagged links collect measurement for later commissions; market can have verified page/roster/campaign; payment initiation and fulfilment orchestration via partners; evidence/provenance/source rights/correction/claiming/moderation/audit operational; platform can measure search-to-contact, response, freshness, recommendation quality, profile claims, verified outcomes. Does not mean nationwide depth, every category, mature transaction protection, public APIs, automated intelligence across economy.

1.4 Launch wedge

Home, Power and Building in Harare: solar/batteries/inverters, electrical/plumbing supplies, hardware/building materials, selected appliances/furniture, installation/repair services. High intent, meaningful availability differences, quote-based, compatibility questions, strong video value, margins for advertising, diaspora relevance. Reference library retains 1M+ masters primarily global food data, therefore cannot be treated as wedge readiness. Before public launch must create separate wedge corpus: 20k+ category-relevant product/variant/service identities from rights-cleared sources or merchant-authorized enrichment; complete attribute schemas for top 2k demand entities; compatibility relationships for batteries/inverters/solar/electrical/plumbing/appliance parts; Zimbabwean aliases/abbreviations/units/misspellings/local-language synonyms; merchant-offer attachment rules and human review queues. Default buyer experience is Local Commerce Search: fresh branch-linked offers, active merchants, services, market pages, Request Network. Wider million corpus exposed via clearly named Reference Library/enrichment workflow. Reference-only items must not dominate buyer results or imply sold in Zimbabwe.

1.5 Launch and month-three operating envelope

Target	Binding Target	Interpretation
Master reference library	1M+ indexed	Separate partition, source/licence preserved, local availability never inferred
Launch-wedge corpus	20k+ relevant identities	Attributes, aliases, compatibility prioritised
Organisations/merchants	10k+ claim-ready	Source-labelled, never counted as active until claimed/operating
Activated merchants	50-100 claimed responses	Release depends on activation economics and coverage cells
Local offers	3k-5k fresh branch-links	Each has price/availability evidence and freshness state
Places	National scaffold loaded	Correction continuous
Markets/clusters	Public markets loaded, 500+ comments	Correction requires reviewed evidence
Creators	20-40 trained	Fixed-bounty, no outcome commissions at launch
Clips	250-500 catalogue-linked	Moderated, rights-cleared, canonical-link compliant
Recommendation	Rules/hybrid cold-start	Learning-to-rank gated
Merchant claiming	Ownership/correction/24h precision	Dispute live
Payment rails	≥2 provider/rail options	Shoppage does not hold funds
Fulfilment	Collection, merchant delivery, partner quote	Assembly
Freshness	≥80% visible inside catalogue	Style auto-rotate, loses ad eligibility
Usable coverage cells	≥3 cells with 3 merchants	At least 50 comments/60% responses

2. Zimbabwe Ground Reality

Public evidence: e-commerce predominantly urban and informal, Facebook Marketplace and WhatsApp central to discovery/negotiation, cash/cash on delivery/mobile payments common vs card-first checkout. Digital 2026: 6.54M internet users, 2.60M social identities, 16.2M active cellular connections. UNCTAD identifies diaspora demand, weakly structured logistics, informal providers, last-mile gaps, need for pickup centres, skills constraints, incomplete legal environment. Supports meaningful mobile opportunity but does not justify designing as though every connection is active shopper or stable broadband.

Ground Reality	Required Response	Failure Avoided
Commerce starts on social	Shareable cards/clips/links returning to Shoppage	Direct channel abandonment
Trust is local/relationship-based	Progressive verification, locations, response history, peer-backed reviews	Response history, peer-backed reviews
Connectivity uneven	Low-data mode, manual location, voice/image mediation	Unusable resilient forms
Payments mixed	Cash, collection, mobile money, trade at provided first point	Trade at provided first point
Logistics fragmented	Quote, collection, partner orchestration	Provisional national fleet
Merchant capability varies	Assisted onboarding, voice/image suggestion, managed campaigns	Suggestion, managed campaigns
Currency changes	Multi-currency model, dated exchange rates	Hard-coded prices
Business data fragmented	Preload several sources, preserve provenance, enable claims/verification/corrections	Preload, provenance, verification/corrections

Inclusion: smartphone-first not smartphone-exclusive, text-first/low-data browsing, manual city/suburb/landmark/market selection, agent-assisted onboarding/verification, shareable links without app install, English at launch + progressive Shona/Ndebele search/prompts/support, voice-note/image-assisted ingestion, clear price dates/currency labels, no forced buyer registration before search/contact.

3. Vision, Mission and Brand Architecture

Vision: Make Zimbabwean commerce visible, searchable, trusted, measurable and locally valuable. **Mission:** Organise merchant identity, places, products, services, offers, demand, content and commercial outcomes into

continuously improving local commerce graph to help buyers resolve needs, merchants grow, creators earn, markets digitise, institutions understand commerce without selling personal data. **Positioning:** For buyers find what is available, where, who trusted, how to obtain. For merchants publish once, maintain commercial truth, reach local demand, measure every meaningful action. **Brand rules:** Shoppage master brand. Central/Showcase/Ads/Creators/Markets are internal domains and specialist workspaces, not five consumer brands. One identity, catalogue, trust system, billing, analytics across domains. Public: Sell (create/maintain Merchant Site, catalogue, market presence, leads, payment/fulfilment), Discover (search, browse nearby, watch useful media, compare, post requests), Grow (promote, commission content, understand demand, improve). Buyer never decides Showcase vs Markets; buyer searches Shoppage. Recommended structure: shoppage.co.zw public discovery/requests/market pages/Merchant Sites; manage.shoppage.co.zw merchant Sell workspace; grow.shoppage.co.zw advertising/creator/growth workspace; developers.shoppage.co.zw later portal; market pages at /markets/{slug}. Domain/trademark due diligence required.

4. Shoppage System Architecture

Shared horizontal engines: Identity and organisations (tenant isolation, auditable authority), Places and markets (evidence-based relationships), Catalogue and offers (product identity separated from seller offer), Search and discovery (relevance/freshness before paid influence), Trust and safety (human appeal for high-impact), Content and media (every clip links to structured objects), Advertising and attribution (transparent labels, relevance floors), Payments and fulfilment (no unlicensed custody), Intelligence and AI (evidence/evaluation/human review), Billing and entitlements (clear invoices, auditable balances). Primary participants: buyers, informal/formal merchants, branches/stalls/providers, creators/affiliates/community operators, markets/malls/clusters, brands/distributors/manufacturers, payment/fulfilment/POS partners, field/moderation/support/data teams, approved powered businesses.

Core journeys: Merchant: preload/resolve org/branch → expose claim-ready → authorised rep claims/corrects → verify predicates → create Merchant Site → attach masters/variants/current offers → confirm freshness → publish content → receive leads → promote → record outcomes → improve. Buyer: search/browse/ask → choose location/constraints → inspect product/merchant/freshness → compare total outcome → contact/request/reserve/initiate payment → choose collection/delivery → receive proof/support → save need/review. Creator: apply/verify → select approved merchant/product → create/upload → disclose → tag canonical objects → publish → generate attributable action → pass fraud/dispute → payout. Market: resolve operator/boundary → create structure → onboard merchants/stalls → publish page → maintain roster/hours → run campaigns → measure traffic/demand/outcomes.

Independence doctrine (Binding): Shoppage operates as complete core without Facebook/WhatsApp/TikTok/Google. External platforms accelerate acquisition/distribution but cannot be required for identity, canonical content, search, requests, leads, maintenance, outcome history. Identity owned: canonical Shoppage ID, phone/email OTP default, social login optional, Facebook Page IDs etc stored as revocable external_identity with source/scope/confidence/last-verification, no external ID as primary key. Content owned: Merchant Site/product/variant/offer/market/creator asset/campaign canonical; external post is render/referral linking back to stable Shoppage object; imported observations create evidence/review events, never silently overwrite merchant-authorized truth. Demand owned via Freshness truth, Operational proximity, Structured Request Network. External adapters optional translators, scoped, compliant; where no API, provide user-initiated sharing, export cards, copy-ready text, canonical links, QR. Unauthorised scraping not core growth strategy. Core: Identity, Organisation, Product, Offer, Request, Lead, Content, Outcome. Optional adapters: Facebook, WhatsApp, TikTok, Google, POS, ERP, payments, fulfilment. Rule: core events may export to adapters; critical core flows never require adapter availability. Kill switch: disabling any adapter must not block login/publish/search/request/lead/maintenance.

Independence acceptance criteria before controlled launch: application boots and core buyer/merchant flows pass with all social adapters disabled; no social login or external ID required to recover account; every outbound social object resolves to canonical Shoppage URL or documented export artifact; adapter timeout/revocation/policy-change tests do not corrupt core data; installable PWA can display cached Merchant Sites/products/saved needs/operating info while offline; merchant draft changes queue locally and sync safely;

full server search/payment status/live availability never falsely presented as current while offline; merchant data/media exportable in documented format; external-platform concentration dashboard tracks referral dependence and direct/owned return.

5. Shoppage Central — Merchant Operating System

Central must create standalone value before Shoppage has national buyer traffic. Merchant Site as authoritative commercial reference: verified business/branch profile, products/variants/services/prices/freshness, images/clips/offers/collections, maps/hours/delivery zones/collection, payment methods/transaction options, WhatsApp/call/quote/reservation actions, policies/warranties/FAQs/trust signals, structured metadata for public search, QR/shareable links, analytics/attribution. Workspace: Today (leads, stale stock, price checks, urgent actions), Catalogue (products/variants/services/media/imports, draft/review/audit), Offers (price/currency/availability/branch/validity, freshness/evidence), Content (clips/cards/captions/collections/QR, rights/moderation), Leads (calls/WhatsApp/RfQs/reservations/notes, source/status), Ads (simple objectives/budget/geography/reports, spend caps/relevance), Creators (invitations/bounty contracts/assets/later commissions), Intelligence (demand/gaps/response/improvement, confidence/privacy), Settings (staff/roles/branches/policies/integrations, least privilege/audit). Ingestion: manual mobile, spreadsheet/CSV, authorised POS/ERP/distributor feed, image/PDF extraction with confirmation, voice note/WhatsApp-assisted draft, agent-assisted field capture, later API/plugin. AI may draft titles/attributes/categories/variants, merchant confirms before publication. Freshness: observed/confirmed time, price-valid-until, stock state/confidence, branch/service area, evidence source, stale-after rule, reconfirmation path, customer correction path. States: confirmed, recent, aging, stale, unknown, disputed. Search/ads downgrade/exclude stale/disputed. Improvement loop tells merchant what to do next: confirm 14 offers expiring, reply to 3 high-intent requests, add missing attribute, create 20s demo, extend delivery to unresolved demand area, stop ad whose stock unavailable, compare response time vs benchmark.

6. Shoppage Showcase — Discovery

Showcase must earn direct use before broad media scale. Promise: find credible nearby option that can serve now, or route request to someone who can. Operational rules: 10-60s clips, muted autoplay only where data allows, captions/thumbnails required, low-data mode/conservative preloading, content rights recorded, current price/stock overlay or stale warning, clear disclosure, reporting views/saves/opens/contacts/outcomes. Native demand wedge tests measure whether buyer resolves need faster with less uncertainty than posting in group/scrolling/calling shops. Default Local Commerce Search prioritises fresh offers, active merchants, services, market pages, Request Network. Reference Library secondary. Showcase search supports keyword, semantic, filter, location across masters/orgs/markets/local offers, manual location/nearby discovery, Ask/Request flow, WhatsApp/call/quote attribution, save/share/alerts, trust/report controls, cold-start recommendation alpha, controlled buyer tests. Video feed supportive discovery, not primary retention.

7. Shoppage Ads — Local Commerce Media

Ads moves measurable share of Zimbabwean commercial ad spend from broad global attention platforms into local outcome-oriented commerce media. Doctrine: sell intent/attributable action not vanity engagement, protect organic relevance, promote only eligible merchants/products/services/content, display paid labels clearly, simple objectives for SMEs/deeper controls later, report buyer action that followed ad, exclude political ads initial period, independent ad-integrity function with authority to reject revenue. Launch products: Sponsored product (high-intent demand, budget/click or fixed), Sponsored Merchant Site (store/branch visibility, fixed duration/impression), Sponsored clip (demo/launch, budget/view with action reporting), Nearby deal (local availability/store traffic, area-duration), Market sponsorship (contracted), Request matching (qualified buyer request access, qualified lead/subscription), Managed campaign (service fee + media), Creator campaign (fixed bounty at launch, verified-outcome commission only after gates). Workflow: select objective, select product/Merchant Site/market/clip, choose location/category/duration/budget, automatic quality/stock/policy/reach checks, publish automatically for low-risk trusted or review, apply frequency limits/organic safeguards, report spend/reach/actions/response/verified outcomes, provide recommendations

without silently changing budget/targeting. Substitution metrics: Commercial Discovery Share, Merchant Advertising Wallet Share, Local Advertising Value Retention (net local after imported infra/processing/software). Should not claim every dollar remains in Zimbabwe; credible claim more capability/data/jobs/payouts/partner revenue/tax retained locally. Cold-start rule: revenue from managed campaigns/market packages/onboarding bundles/limited sponsored placements months 0-3; large-scale self-service only after search volume/repeat/outcome measurement credible.

8. Shoppage Creators — Distribution, Education, Digitisation

Creators are core distribution/education/merchant-digitisation/content-production network. Roles: Commerce creator (demos/reviews, bounty), Market creator (walk-throughs/discovery, market package), Specialist creator (technical education, guide fee), Catalogue creator (media/data capture, service fee), Community operator (distribution to trusted audience, post/distribution bounty), Affiliate curator (collections/tagged recommendations, measurement pilot then commission). Tier 1 months 0-3 fixed verifiable bounties: payable only when merchant/products/deliverables/rights/fee agreed in advance, canonical Universal Link/QR used, disclosure present, content remains available for contracted verification period normally $\geq 48h$, verification no rights/fraud breach. Tagged links/events collected for learning, not pay. Tier 2 months 4-6 verified lead commissions only after unique-link attribution, duplicate detection, merchant response workflows, dispute handling, payout reconciliation pass gates. Eligible events: qualified lead, accepted quote, completed reservation, verified collection/confirmed transaction where supported. WhatsApp click alone not sale; combine tagged session + consented/structured lead + duplicate-phone/device checks + merchant response + sampling/audit. High-risk categories excluded. Canonical-link rule: every paid post must use stable Shoppage Universal Link surviving copying between Facebook/WhatsApp/SMS/browsers, retaining privacy-safe attribution, opening relevant Merchant Site/product/request, degrading gracefully on low-data. Safeguards: disclosure, merchant approval, music/image/customer-consent/rights, anti-self-referral/duplicate/collusion, review windows, category restrictions/expert review, creator appeals/merchant disputes, tax/contractor treatment, follower count/views never sufficient payout.

9. Shoppage Markets — Market-in-Market Infrastructure

Markets turns physical clusters into searchable/measurable/promotable digital units. Types: malls/shopping centres, formal/informal markets, CBD retail clusters, industrial/hardware districts, trade fairs/temporary events, growth points/rural centres, distributor/franchise networks, diaspora-oriented collections. Market page includes: verified operator/governance, location/boundary/navigation, current merchant/stall roster, categories/products/services, hours/event dates, clips/offers, collection/delivery info, complaints/correction path, campaign/sponsorship inventory, market-level analytics. Market evidence: market-inside-market/building/section/store/stall relationships cannot be inferred from nearby coordinates alone; operator records/municipal evidence/field verification/address evidence/reviewed polygon relationships required. Market Captains may onboard merchants, maintain rosters, capture media, coordinate campaigns, escalate disputes. Requires defined authority/territory, training/ID, audit trails/quality score, separation verification vs personal commercial interest, anti-bribery/complaint controls, compensation tied to accepted work/durable activation not raw registrations. QR infrastructure at stores/markets/events/receipts/packaging/delivery points.

10. Merchant Sites and Pemosites — Source-of-Truth Model

Binding: Every merchant receives Shoppage Merchant Site. Merchants with effective existing websites keep them and connect via feeds/APIs/embeds/attribution. Shoppage does not force migration. Source-of-truth per field: legal identity may come from verified merchant/regulator evidence; product master Shoppage-controlled; price/stock merchant POS-controlled; editorial corporate content website-controlled; trust/response history Shoppage-controlled. No bidirectional sync without conflict rules/timestamps/ownership/recovery. Pemosites initially premium product line using Shoppage core, not separate operating company. Serves businesses needing more than commerce storefront: corporate/service pages, custom brand presentation, news/resources/careers, forms/bookings/lead workflows, custom domains/email setup, managed

content/SEO/migration, integrations beyond marketplace. Must reuse identity/products/branches/offers/analytics/permissions, must not create parallel merchant/product DB. Spinout gate: ≥ 100 paying sites or equivalent contracted recurring revenue, repeatable acquisition/onboarding, sustainable gross margin after support labour, standardised product not bespoke agency, separate management capacity, clear IP/data-processing/cross-selling agreements. Months 0-3 build shared Merchant Site engine. Months 4-6 may pilot 10-20 Pemosites per v1.1, but v1.1.1 defers beyond month 6 and cannot consume launch engineering capacity per binding correction 7.

11. Commerce Intelligence Graph and Preloaded Launch Inventory

Strongest moat is governed continuously improving evidence graph connecting organisations, branches, places, markets, products, variants, offers, content, demand, outcomes. Validated foundation: 6,101 org-source records/5,281 distinct names, 5,899 ISIC-mapped, 1M unique global food-product identities, 950,334 checksum-valid GTINs, 466,276 family keys, 25,210 place/market nodes/25,209 parent edges, 118 explicitly tagged markets/malls, versioned merchant-offer feed contract/idempotent observation store/exact-GTIN matching/review queue. Binding v1.1.1 launch expansion: retain/productionise 1M+ master reference catalogue, add several rights-cleared product/brand/classification/compatibility/attribute sources, ingest/resolve $\geq 10k$ org/merchant profiles from authoritative/licensed/purchased/partner/public discovery sources, load national place scaffold and all known public markets, create claim-ready Merchant Sites + ownership/correction workflows, ingest merchant-authorised offers as soon as feeds/claims/field onboarding arrive, deploy cold-start recommender + local intelligence layer. Current package proves foundation counts; additional 10k+ multi-source targets become public claims only after source ledgers/validation reports pass; not proof every company currently trading or product sold locally or market relationship officially confirmed. Stable entities vs time-varying claims: Organisation currently trading, Branch operating at location, Master product sold by merchant, Variant in stock at branch, Place/market contains store/stall, Creator authorised to promote offer, Merchant responds reliably, Offer price valid. Each production claim preserves source system/type/authority, predicate scope, source identifier/permitted reference, observed/retrieved time, evidence hash/immutable reference, reuse rights/restrictions, confidence/verification state, reviewer/decision reason, validity/supersession history, unresolved conflicts. Coverage cell = place-category-fulfilment mode tracking verified merchants/branches, active markets, fresh offers/variant depth, price/stock recency, response rate/verified outcomes, buyer demand/unresolved requests, trust/complaint signals, coverage state empty/thin/usable/strong/authoritative guiding field ops/creator tasks/category launches/ad availability/honest national reporting. Intelligence products: Buyer (Ask/saved needs, Price Pulse with date/currency/comparable context, Stock Truth with confidence/confirmation time, Compatibility Graph, local substitution/alternative suppliers, total-outcome comparison), Merchant (Business Improvement Copilot, demand gaps, response/conversion diagnostics, completeness/freshness, pricing/assortment benchmarks, campaign/creator recommendations, branch/delivery-zone opportunities), Market/brand/institutional (category demand/stock-out patterns, market/cluster performance, reseller/distribution visibility, price/availability trends, digitisation/local-value scorecards, privacy-safe aggregated planning). Monetise intelligence not raw personal data or merchant-confidential records. Preloaded inventory four distinct: Master reference catalogue (1M+ products), Organisation/merchant graph (10k+ businesses), Place/market graph (national places/clusters), Historical Commerce Archive (time-stamped observations). Every record canonical ID, source ledger, rights class, observation date, confidence, review state, current-state status, correction path. Search/AI may use incomplete records but interface must communicate uncertainty. Merchant claiming workflow: phone/email-domain/document/branch/association/field-agent/authorised-partner evidence, organisation/branch resolution before ownership, owner/manager/delegated staff roles, duplicate merge/mistaken-identity review, correction requests from merchants/public, appeals when rejected/challenged, audit history, export of merchant-managed data/revocation of staff access. Merchant claim gives authority over current trading fields/catalogue/offers, does not permit deletion of lawful regulator records/historical evidence/complaints/source provenance/other parties rights. Unclaimed profiles clearly labelled, never impression Shoppage represents business.

12. Defensibility and Network Effects

Competitor can copy storefront/video feed, cannot reproduce 12 assets overnight: preloaded/verified commerce graph, fresh local offer network, merchant operating workflow, trust/outcome history, geo/market relationships, creator attribution graph, buyer demand graph, advertising performance graph, framework ecosystem, Historical Commerce Archive, merchant claim network, local model advantage. Compounding loops: Supply (more activated merchants → more useful offers → better buyer resolution → more leads → stronger retention → more first-party data), Demand (more searches/requests → better demand insight → targeted acquisition → deeper coverage → more resolved searches), Trust (more verified outcomes → stronger reputation → higher conversion → more measurable outcomes → better risk models), Creator (more attributable products → better earnings → more useful content → more discovery → merchant participation), Framework (more approved extensions → more reuse/observations → stronger core → lower marginal cost). Copy-resistance: never reduce graph to scrapeable public directory, keep public APIs scoped/rights-cleared, preserve evidence/change history internally, give merchants export rights without exposing others confidential data, use contracts/rate limits/anomaly detection/canary fields against bulk extraction, do not claim proprietary ownership over third-party data beyond legal rights, make service quality/field relationships/operational learning as important as code.

13. Daily Utility and Responsible Habit Formation

Product becomes daily habit because resolves real tasks not manipulates attention. Buyer return reasons: stock/price alerts, saved needs/matched requests, nearby availability/open-now updates, trusted deal/new-stock feeds, creator buying guides, repeat household/business lists, service reminders/compatibility/replacement needs, market events/local news. Merchant return: stale stock/price actions, new leads/response queues, campaign/creator results, product-demand signals, unresolved requests, trust/complaint/fulfilment actions, daily Business Improvement Copilot recommendations, branch/market performance. Responsible engagement: no infinite-scroll coercion, deceptive notifications, fake scarcity, hidden sponsorships, unreadable cancellation, fabricated social proof. Notification frequency controllable. Video feeds natural stopping points and data controls. High-value systems sequenced by gates: Ask/Request Network, Price Pulse, Stock Truth, Compatibility Graph, Merchant Reputation Passport, Verified Collection Network, Universal Merchant Link/QR, WhatsApp/voice ingestion, Diaspora Purchase Concierge, B2B Procurement Exchange, Made in Zimbabwe Discovery, Proof-backed reviews, Commerce Academy, Business Improvement Score, Community Correction Network, Commerce Continuity View.

14. AI-Native Operating Model

AI is productivity/quality/intelligence layer, not permission to publish unverified claims or fragile software. Launch AI capabilities: Merchant ops (extract draft products from images/PDFs/spreadsheets/messages, clean titles/descriptions, suggest categories/attributes/variants, identify duplicates, generate captions/cards/price overlays, prioritise stale/incomplete records, assist support/onboarding agents), Buyers/discovery (interpret natural-language/voice requests, expand local synonyms/brand nicknames, match requests to qualified merchants, recommend compatible/locally available alternatives, produce cold-start recommendations from preloaded graph before behavioural scale, distinguish global reference matches from current Zimbabwe offers, summarise differences with uncertainty shown), Trust/ops (detect suspicious pricing/duplicate scam images/anomalous behaviour, prioritise moderation/resolution queues, identify data-quality regressions, draft not decide high-impact cases). AI data/model architecture: Commerce Intelligence Graph as governed retrieval/feature system, product text/social history/purchased directories/partner data/merchant feeds enter separate provenance partitions, training/retrieval access by rights class not technical availability, provider-independent adapters, internal model registry, reproducible evaluation sets, shadow tests/fallbacks, cheapest model meeting measured quality for high-volume classification/extraction/embeddings, sensitive/rights-restricted data not sent to third-party models without approved basis/contract. Evaluations: entity-resolution precision, category/attribute extraction, multilingual query recall, recommendation relevance, geographic validity, offer freshness, hallucination rate, bias across merchant size/location, human-review workload. Human decision boundaries: identity-verification rejection, serious fraud labels, account suspension/permanent removal, disputed payment/fulfilment liability, high-impact entity merges,

unsafe-category publication, material public/government reporting require human approval/appeal. Each production model requires defined task/permitted inputs, Zimbabwe-specific eval set, baseline/acceptance threshold, error taxonomy by language/category/user group, privacy/security review, cost/latency budget, fallback, drift/abuse monitoring, rollback path/owner. AI-assisted dev controls: modular architecture/typed contracts, tests written with/before generated code, human review for auth/payments/permissions/migrations, dependency/licence scanning, no secrets in prompts/repos, ADRs, staging/feature flags/rollback, observability from first release.

15. Trust, Safety and Consumer Protection

Trust is product system not badge. Progressive verification levels: phone/email, authorised rep, identity, physical location, legal business identity, regulated licence/professional credential, bank/payment destination, brand/authorised-dealer status, market/operator membership. Badges must state exactly what checked and when. Verified cannot imply guarantees beyond scope. Reputation combines time on platform, last active/freshness behaviour, response rate/time, accepted/declined request history, verified collection/fulfilment outcomes, complaint severity/resolution, policy/warranty adherence, data accuracy corrections. Proof-backed reviews weighted by evidence such as verified contact/quote/reservation/payment/collection/fulfilment. Unverified comments displayed separately or used as reports. Category safety: counterfeit, unsafe, regulated, prohibited services, misleading health/financial claims, age-restricted, stolen goods, IP complaints. High-risk categories stricter controls or exclusion. Disputes system: clear report types, evidence upload, response deadlines, merchant/creator appeal, neutral review ownership, severity escalation, outcome/remediation history, regulatory/law-enforcement referral where legally required.

16. Payments and Transaction Ownership

Binding: Shoppage owns commercial workflow/evidence record. Licensed providers process/settle money. Vendor remains seller/merchant of record for ordinary sales unless later explicitly contracted model states otherwise. Shoppage will not initially hold customer funds, pool merchant settlements, operate deposit wallet, store card numbers/CVV/mobile-money PINs, promise escrow without licensed structure, become merchant of record by default. Zimbabwe already has domestic infrastructure including Zimswitch Online and Paynow merchant/e-commerce services. Payment methods: cash on collection, cash on delivery where merchant/partner supports, mobile money, bank transfer/ZIPIT-style, provider-hosted card/online checkout, payment link, deposit/reservation payment, later buyer-protection/escrow-like products through licensed partners. Responsibilities: display accepted methods/conditions, initiate provider payment, create order/reservation reference, receive signed status callbacks, reconcile status/exception records, issue Shoppage transaction evidence/merchant receipt links, preserve dispute/refund evidence, calculate platform fees where contracted, prevent ads/content falsely implying payment protection. Provider-adaptor standard: idempotency, signed webhooks, replay protection, timeout handling, reconciliation, refund/status mapping, sandbox testing, incident ownership, provider exit procedures. Ad credits may be prepaid promotional credits for platform advertising, limited-purpose, non-withdrawable, accounted as service credits, must not be marketed/operated as general stored-value wallet.

17. Fulfilment and Last-Mile Delivery

Binding: physical fulfilment partner-led/merchant-led but cannot be invisible/off-platform. Shoppage orchestrates options/quotes/statuses/evidence without initially owning national fleet/warehouse. Supported modes: buyer collection from branch/stall, verified collection point, merchant delivery, courier/delivery partner, installer/technician fulfilment, long-distance bus/courier route, buyer-arranged bulk haulage, scheduled market/event pickup. Responsibilities: collect dimensions/weight/category/handling constraints where relevant, show service area/delivery assumptions, request/compare quotes, capture selected provider/reference, display dispatch/pickup/delivery states, collect proof of collection/delivery/installation, record failed attempts/cancellations/complaints, maintain merchant/partner performance histories, separate delivery fee/platform fee/merchant price. Category-specific: small parcels/electronics standard rates/tracking/proof, building materials quote/vehicle type/distance/offloading, solar/installations product + technician scheduling,

furniture/appliances scheduled delivery/condition proof, informal markets verified collection desk/captain coordination. Asset-ownership gate: owned vehicles/warehouses/dark stores require specific zone/category business case with sustained density, positive fully loaded economics, unacceptable partner failure, dedicated operational leadership, not default ambition.

18. Data Governance, Rights and Compliance

POTRAZ is Data Protection Authority and publishes Cyber and Data Protection Act implementation guidance. Must obtain Zimbabwe legal advice on data-controller registration/licensing, DPO requirements, cross-border processing, cookies, direct marketing, children, biometric data, breach notification before public scale. Core controls: purpose limitation/data minimisation, transparent privacy notices, role-based access/least privilege, consent where required, DSAR access/correction/deletion workflows, retention schedules, cross-border processor register, encryption in transit/at rest, incident response/breach records, vendor/plugin DPAs. Rights/licensing: every source requires inventory ownership/licence/permitted use/attribution/share-alike implications/personal-data basis/AI-training permission/refresh method/correction route/termination risk/required deletion propagation. Purchased directories/collaboration feeds require contractual warranties covering provenance/collection authority/permitted commercial display/derivative analytics/AI use/update cadence/security/correction/takedown/indemnity. Bought does not automatically mean rights-cleared. Public social history requires separate collection policy: platform-authorized APIs, merchant/user-provided exports, partner agreements, manual/field observations permitted by law, other methods cleared against platform terms/data-protection obligations. Public visibility alone does not authorise unrestricted scraping. One-million-product Open Food Facts-derived reference requires explicit ODbL/database-content review before public combination/redistribution/commercial derivative use. Keep source-derived and merchant-proprietary separable where legally/technically necessary. Merchant/buyer data: merchants own original content subject to licence to operate Shoppage, merchants can export own catalogue/transactions, Shoppage owns platform-generated models/aggregate analytics/system records subject to law/contracts, one merchant confidential performance cannot be exposed to another, personal data not sold, aggregate intelligence uses minimum cohort sizes/suppression controls, partner access purpose-limited/logged/revocable. Consumer/advertising compliance before launch: Consumer Protection Act, pricing/discount disclosures, electronic contracting/records, platform/vendor liability, returns/warranties/refund terms, creator/sponsored disclosure, prohibited/regulated goods, courier/postal licensing, tax invoices/commissions/creator payments, market captains/field agents terms.

19. Revenue Model and Pricing Architecture

Needs multiple streams but each must reinforce utility rather than tax immature demand. Hierarchy: Assisted onboarding/catalogue services Launch early cash labour-intensive, Managed campaigns/content production Launch early revenue/learning, Sponsored products/sites/clips/markets Launch with demand limits scalable media, Merchant subscriptions Launch and expansion recurring software, Qualified request/lead products Launch selected categories high-value performance, Creator campaign administration Launch/expansion service/platform fee, Pemosites/premium Merchant Sites Months 4-6 per v1.1 but v1.1.1 defers Pemosites beyond 6 per correction 7, Intelligence products Launch internally Months 4-6 external high-margin rights-sensitive, Framework/API/plugin fees private beta later, Payment/fulfilment orchestration fees later where justified transaction-linked, Native transaction commission later requires strong trust/operations. Pricing hypotheses interview/pilot hypotheses not fixed: Free limited catalogue/Merchant Site/contact actions/basic analytics, Starter \$5-10 larger catalogue/freshness/basic promotions, Growth \$15-30 staff/leads/clips/campaigns/improved analytics, Pro/multi-branch \$50+ depending branches/integrations/support, Enterprise/market/brand contracted, Self-service ads low entry from \$5 subject to useful audience volume, Managed campaign/content/onboarding scoped service pricing. v1.1.1 binding correction 10 simplifies to Free Foundation + one paid Growth Pilot \$19/mo flat while willingness-to-pay/activation economics measured. Pricing tested against merchant gross profit/attributable value not copied from SA/global SaaS. Unit-economics discipline track separately: software gross margin, managed-service gross margin, creator payouts/media cost, field activation cost, support cost by tier,

payment/fulfilment pass-through, infra cost per active merchant/search/video minute, CAC/payback, revenue concentration. Do not hide labour-intensive onboarding inside software margin.

20. Competitive Strategy and Platform Substitution

Current alternatives: Facebook Marketplace/pages/groups, WhatsApp, Google Search/Maps, Classifieds.co.zw, Ownai, ShopAtZim, Hypermarket. Public sites show Classifieds broad categories/free ads, Ownai multi-category cart/comparison, Hypermarket multi-vendor/verified sellers/Paynow checkout. Must not claim competitors no value; wins by solving different combination better. Outclass: Facebook reach/communities weak structured catalogue/freshness/attribution → Shoppage merchant truth/product graph/measurable actions; WhatsApp conversion/relationships poor discovery/comparison/analytics → searchable catalogue/structured handoff; Google broad search/maps limited branch-level local stock/trust history → local offer/freshness/market/response intelligence; Classifieds breadth listing-centric limited merchant OS → recurring workflow/evidence graph; Marketplace checkout transaction-focused limited media/intelligence depth → search/video/ads/creators/markets/framework; TikTok/Reels entertainment attention not linked to current local offer → every clip linked to merchant/product/market/action. Google Shopping substitution aim to resolve Zimbabwe-specific questions generic search lacks: exact variant/compatibility, current branch availability, local price date/currency, merchant response/verification history, collection/delivery feasibility, market/stall context, local alternatives/requests. Objective category-by-category commercial search leadership not replacing general web search. Google/Meta advertising substitution: merchant budget shifts only if better cost per qualified local action. Baseline external ad spend, run controlled campaigns, report comparable outcomes, calculate wallet-share movement. External platforms remain optional acquisition channels during transition; cards/clips/links optimised for Facebook/WhatsApp/TikTok/Google while merchant identity/canonical content/requests/leads/outcome data remain on Shoppage. No external channel may become critical-path dependency or only measurable source of buyer demand. Social-platform independence: win with external where reach, survive without; acquisition may include user-initiated sharing, permitted feeds, creator distribution, public-search indexing; product must continue to acquire/retain via Merchant Sites/QR/saved needs/price-stock alerts/Request Network/market pages/direct notifications/referrals based on resolved needs. Review Owned Demand Share and External Platform Concentration monthly; rising direct/saved/QR/request/notification sessions evidence platform not social-selling utility. Competitive-response system: monthly competitor capability review, quarterly merchant/buyer interviews, public feature/request intake, two-week delivery cycles for measurable improvements, feature flags/experiments, adopt/adapt/reject decision log, no feature matching without clear user/economic outcome.

21. Shoppage Framework and Ecosystem

Framework decision: Shoppage is both product family and reusable commerce framework allowing approved subsidiaries/partners/independent businesses to build specialised applications without recreating identity/product/place/trust/payment/fulfilment/intelligence. Commerce kernel provides identity/orgs/roles/consent, place/market/branch graph, catalogue/variants/offers, search/recommendations/saved needs, trust/verification/disputes, leads/RFQs/reservations/orders, advertising/content/creator attribution, payment/fulfilment orchestration, billing/entitlements, analytics/evidence/AI services. Extension types: First-party module (Price Pulse/Merchant CRM, core roadmap/shared P&L;), First-party vertical (Construction procurement, dedicated owner/shared kernel), Product line (Pemosites, shared data/internal cost centre), Subsidiary (proven specialised business, admission gates/licence), Certified plugin (POS/ERP/payment/fulfilment adapter, review/scopes/support/certification), Powered application (independent market/distributor portal, API contract/consent/usage billing), White-label deployment (association/institutional portal, no DB fork, central identity/evidence rules). Platform rules: no direct third-party DB access, scoped credentials/least privilege, signed webhooks/idempotent writes, merchant consent for plugin access, versioned APIs/deprecation policy, audit every partner action, data export/termination procedure, certification/reliability score, no arbitrary third-party code inside core production, no public app store months 0-6. Subsidiary admission gate: distinct customer/value prop, evidence demand/repeat usage, identifiable revenue/cost structure, dedicated accountable leader, compliance/risk

assessment, strategic reason not to remain module, platform licence/data-sharing agreement, board-approved capital plan. Ecosystem economics possible framework revenue includes API usage, plugin certification, revenue share, platform licence, white-label subscription, managed integration, premium support, intelligence access, begin after core reliability/merchant consent proven.

22. Go-to-Market and Field Operations

Supply-first launch: first problem useful supply not app downloads. Merchant acquisition channels: direct field sales in commercial clusters, distributors/brands introducing stockists, market/mall operator partnerships, trade associations/specialist communities, creator-led merchant onboarding, referrals from payment/POS/bank/telecom partners, diaspora-oriented packages, managed catalogue/content days. Merchant activation standard: authorised rep established, branch/location/contact usable, minimum catalogue quality met, freshness obligations accepted, at least one buyer action completable, response workflow demonstrated, policies/payment/fulfilment methods stated, staff know how to maintain. Buyer acquisition three tiers so social reach accelerates without becoming oxygen: Owned/physical (QR codes at shops/stalls/markets/receipts/quotations/packaging/collection points, memorable Merchant Site/market links, Request Network flyers/category buyer guides, saved needs/stock-price alerts/consented push/SMS/email, market events/merchant referrals/repeat loops), Partner (market/mall operators, creators/community operators, distributors/brands/installers/payment/fulfilment partners, trade associations/campuses/specialist communities), External-platform (user-initiated Facebook/WhatsApp/TikTok sharing, permitted feeds/publishing adapters where legally justified, public-search indexing, paid external acquisition only when economics measured vs direct alternatives). Growth dashboard must separate direct/owned, partner, external-platform demand. Field network needs assigned territory/task, source/evidence capture, duplicate detection, quality review, accepted-work payment, merchant consent, code of conduct, complaint/fraud process, productivity/retention metrics. 1,000-entity programme builds traceable reviewed commerce register not marketing number; includes merchants/branches/markets/creators/distributors/service providers/fulfilment partners/institutions relevant to launch categories; each record source/predicate/date/verification state/owner.

23. International Quality and Technical Architecture

Quality standard: global quality means core experience fast/reliable/accessible/secure/understandable on common Zimbabwean devices/networks. Initial service targets: Availability 99.5% monthly core flows (99.9% after maturity), Web p75 LCP <2.5s on representative 4G, Search p95 <500ms common queries, Crash-free ≥99.5% (≥99.8% later), Accessibility core flows audited toward WCAG 2.2 AA, Data freshness category-specific visible SLA, Security no known critical production vulnerabilities, Support severity/customer-class response targets, Offline resilience cached sites/items and safely queued drafts after install. Technical architecture recommended controlled-launch stack: Next.js App Router PWA for buyer/simplified merchant, Refine or equivalent for dense internal/enterprise admin, NestJS modular monolith as authoritative business layer, Prisma and PostgreSQL/Supabase-managed infrastructure, Meilisearch for catalogue/geo-faceted search across 1M+ masters/orgs/markets/local offers benchmarked, BullMQ/Redis for imports/indexing/notifications/media/AI jobs, managed object storage and dedicated short-video service, vector/embedding and model-feature stores conservatively within PostgreSQL/pgvector or justified managed service, model registry/evaluation harness/corpus manifests/rights-aware retrieval controls, structured logs/metrics/traces/error tracking/security monitoring, pnpm/Turborepo monorepo/shared contracts, optional channel-adaptor layer for social sharing/public feeds/external identities isolated from critical core services. Portability: provider/channel choices adaptor-based, documented export/migration paths for DB/object storage/search/video/messaging/AI/payments/hosting/external distribution. Supabase/Vercel/Railway/Cloudflare Stream/Mux may be pragmatic but no provider unexamined strategic dependency. Production data architecture: SQLite assets for reproducible validation/scale testing only; production requires PostgreSQL multi-tenancy, evidence/history tables, materialised current-state views, review queues, search indexes, access controls, backups/migration testing. Security baseline: MFA for platform admins/high-risk merchant roles, row-level/service-layer tenant isolation, least-privilege service accounts, secrets manager/key rotation, signed uploads/malware scanning, secure webhook validation,

dependency/container scanning, audit logs for data/permissions/payments/moderation, tested backup restore, incident response/breach drills, pen testing before material payment/transaction scale.

24. Months 0-3 Controlled Launch Roadmap

AI-assisted development shortens implementation but field ops/merchant activation/rights/moderation/adoption remain critical path. Four parallel workstreams: product/engineering, commerce data, field/go-to-market, governance/operations. Weeks 1-2 scope/kernel/launch cohort: product/engineering lock domain model/permissions/evidence states/event taxonomy, create monorepo/CI/CD/envs/auth/tenant isolation, implement organisations/branches/places/products/variants/offers, establish observability/feature flags, define canonical IDs/external-identity mappings/channel-adaptor contracts/independence test cases; commerce data import/validate 1M+ master-product foundation into production-ready search partitions, ingest/deduplicate/source-label 10k+ org/profile launch inventory, load national place scaffold/known market inventory, create launch-wedge taxonomy, prepare merchant feed/manual-CSV ingestion, define freshness/verification policies; field/commercial recruit first 20-30 anchor merchants, select 3-5 clusters/markets, establish merchant interview/pricing programme, identify payment/fulfilment/creator pilot partners; governance legal/privacy/payment/consumer review, prohibited categories/content policy, merchant/creator/partner agreements, incident/complaints ownership. Weeks 3-4 Merchant Sites/offer truth: launch merchant claim/ownership-resolution/correction/duplicate-merge/onboarding flow, Merchant Site templates, product-reference attachment/local master/variant creation/branch/offer management, image/CSV assisted ingestion, price/stock/evidence/freshness states, canonical Universal Links/QR assets/user-initiated social sharing, offline-cached Merchant Site shell/queued drafts, internal review queues, field capture app/workflow, first 500-1k usable offers. Weeks 5-6 buyer discovery/requests: keyword/semantic/filter/location search across masters/orgs/markets/local offers, product/Merchant Site/market pages, manual location/nearby discovery, Ask/Request flow/merchant routing, WhatsApp/call/quote attribution, save/share/basic alerts, freshness/operational-proximity/Request Network acceptance tests as native demand wedge, trust/report controls, cold-start product/merchant/request recommendation alpha, first controlled buyer tests. Weeks 7-8 Showcase/creators/markets: catalogue-linked short-video upload/playback, captions/rights/moderation, creator applications/fixed-bounty contracts/canonical-link rules/deliverable verification, tagged-link measurement without launch performance commissions, market pages/rosters/maps/captains, content/market campaign analytics, low-data/data-saver modes. Weeks 9-10 Ads/payment/fulfilment orchestration: fixed-package sponsored products/sites/clips, managed campaign workflow, ad eligibility/labels/spend caps/reports, provider-hosted payment initiation/callbacks, collection/merchant delivery/partner quote options, proof/status/dispute evidence, Pemosites shared-engine prototype per v1.1 but v1.1.1 defers beyond 6. Weeks 11-12 hardening/controlled launch: load/security/accessibility/recovery tests, search relevance/source-state display/recommendation/AI evaluation, content/trust/payment-fulfilment drills, merchant training/support playbooks, analytics/executive scorecard, pilot campaign/fixed creator-bounty payouts, social-adaptor kill-switch/external-platform outage drill, public launch to bounded geography/category, day-30 improvement backlog. Month-three release gates: no critical security defects, tested backup/rollback, 1M+ masters indexed with source/licence partitions, 10k+ org/merchant profiles loaded with claim/correction paths, national place scaffold/known-market inventory queryable, 50+ activated merchants or justified revised threshold, $\geq 3k$ fresh local offers or sufficient category coverage, stable search-to-contact flow, merchant response/complaint process working, ads clearly labelled/attributable, payment/fulfilment provider responsibilities documented, privacy/terms/consumer policies published, operating team can resolve incidents without developers improvising, core login/claim/correct/publish/search/recommend/request/lead/maintenance flows pass with all social adapters disabled, creator bounty verification/rights/dispute operational. Explicit exclusions: national fleet/warehouse, Shoppage wallet/fund custody, every category/province, public plugin marketplace, unrestricted public APIs, fully automated verification decisions, mature loyalty/escrow/refunds/returns engine, native mobile apps unless PWA evidence proves insufficient, manual perfection of every 1M+ reference product before launch (enrichment automated prioritised by demand/risk/local relevance), unauthorised scraping/automated publishing violating external-platform rules, performance-based creator commissions before attribution/deduplication/dispute gates pass, full offline search/live stock/payment-status claims when disconnected.

25. Months 4-6 Expansion Roadmap

Expansion conditional on launch evidence not calendar alone. Entry gates: repeat buyer use in covered categories, merchant response/freshness above target, measurable campaign outcomes, support/moderation capacity, payment/fulfilment incident rate within limits, positive unit-economics trajectory for ≥ 1 revenue stream, reliable evidence/rights controls, creator link attribution/dedup/dispute/payout reconciliation pass before outcome commissions enabled. Expansion priorities: deepen Harare local-offer truth while maintaining national reference discovery, increase merchant profile claim/correction/verified-current-operation rates, tune local recommendation/ranking models using measured outcomes/explicit feedback, replicate to Bulawayo or next strongest evidence-based city, add selected electronics/auto/agriculture/service verticals only after taxonomy/partner readiness, expand creator marketplace/market sponsorships, introduce verified lead commissions only for approved categories/creators after Tier 2 gate, pilot Pemosites with 10-20 businesses per v1.1 but v1.1.1 defers per binding correction 7, introduce self-service ads to proven merchant cohorts, launch saved needs/Price Pulse/deeper compatibility, add more payment/fulfilment adapters, private developer portal/TypeScript SDK, 3-5 certified integrations, one powered market/distributor/procurement app, privacy-safe aggregate intelligence pilots, diaspora purchase/proof-of-fulfilment pilot, formal evaluation of one vertical as product line/subsidiary. Expansion rule: new city/category receives investment only when merchant anchors, field/partner owner, product taxonomy/safety policy, sufficient buyer demand/requests, payment/fulfilment feasibility, support capacity, measurable coverage-cell plan, budget/stop criteria ready.

26. Metrics, Economics and Investor Proof

North-star: Resolved Local Commerce Needs: buyer needs reaching credible outcome through fresh attributable Shoppage path. May be verified contact, accepted quote, reservation, collection, fulfilment, transaction, confidence levels separate. Core metric tree: Supply (activated merchants, fresh offers, variant depth, coverage cells; guardrails accuracy/rights/retention), Demand (searches, recommendations, requests, repeat users, resolved needs, owned-demand share; guardrails failed-search/irrelevant recommendations/complaint/external-platform concentration), Conversion (search-to-product, product-to-contact, response, quote acceptance; guardrail duplicate/fake leads), Ads (spend, cost per qualified action, wallet share, repeat advertisers; guardrail organic relevance/complaint rate), Creators (accepted bounties, useful content, tagged-link learning, later attributable outcomes; guardrail rights/fraud/disclosure/duplicate/payout disputes), Markets (active merchants, roster freshness, market traffic/actions; guardrail operator disputes/stale rosters), Operations (review backlog, support time, freshness SLA, incidents; guardrail staff workload/quality), Economics (revenue, gross margin, CAC, payback, retention, concentration; guardrail service labour/imported costs). Investor proof milestones: By month 3 controlled product end-to-end with social adapters disabled, curated supply/buyer actions, foundation-to-production data path operational, ≥ 1 paid revenue stream real customers, no material compliance/security blocker, evidence-driven roadmap. By month 6 repeat merchant/buyer behaviour increasing owned/direct demand share, multiple revenue streams separated margins, advertising outcome evidence, category/city replication playbook, platform reuse through Pemosites or one powered app (v1.1.1 defers Pemosites, reuse via one powered market/distributor app satisfies), improving coverage/data quality, credible capital plan next 12-18 months. Safeguards: do not count reference records as active inventory, registrations as activated supply, separate GMV/leads/verified sales, disclose related-party/partner concentration, separate software/service margins, maintain board-visible data-rights/security incidents, gate subsidiaries/capital allocation, track imported infra exposure, preserve PlatformCo IP/data-contract ownership.

27. Governance, Organisation and Decision Rights

Initial operating units: Product/engineering, Commerce data/intelligence, Merchant success/field ops, Buyer growth/content, Ads/creator partnerships, Trust/safety/support, Finance/legal/admin. Small team may combine roles but accountability explicit. Minimum launch team indicative: product/venture lead, technical lead, 2-4 full-stack engineers, product/design lead, data/search engineer or strong backend equivalent, field/merchant activation lead, 2-6 agents/captains depending target, trust/support operator, ads/creator commercial lead, fractional finance/legal/security specialists. Plan adjusted to actual funding; targets reduced before quality

controls removed. Decision rights: Product scope product lead with executive escalation, Architecture/security technical lead security veto on critical risk, Verification/trust independent trust owner with appeal process, Ad integrity separate from sales quota, Data rights/privacy designated owner/counsel, Payment/fulfilment provider acceptance cross-functional risk review, Subsidiaries/white-label deals board approval, Public claims/government reporting evidence owner/executive sign-off. Operating cadence: daily launch ops review, weekly product/data/field scorecard, fortnightly release cycle, monthly unit-economics/risk review, quarterly strategy/competition/portfolio review, formal incident post-mortems. Mission-critical execution doctrine: Shoppage compulsory strategic programme in sense leadership committed to solving problem not risks/laws/evidence ignored. Non-negotiable operating rules: one accountable executive owner/one weekly cross-functional launch room, single binding backlog tied to v1.1.1 gates not parallel wish lists, manual operational fallback for claims/ingestion/search correction/leads/payments/fulfilment, no single-source dependency for data/distribution/hosting/AI/payments/logistics, minimum cash/runway/contingency thresholds before expansion, weekly truth review covering claims/source rights/security/buyer harm/merchant outcomes, rapid scope reduction when feature threatens core search/claim/offer/request flows, field ops treated as first-class product capability, unresolved blockers escalated with owner/decision date/fallback path, no fabricated metrics/all Zimbabwe claims/hidden uncertainty. Answer to obstacles is redundancy/evidence/iteration/field execution/focus.

28. National Impact Readiness and Institutional Engagement

National-scale credibility cannot be manufactured through endorsements and must not substitute for product-market evidence. Become institution-ready through measurable non-partisan public value, independent governance, transparent safeguards. Public-value case: MSME/informal-merchant digitisation, locally retained advertising capability/income, creator/agent/market employment, improved discovery of Zimbabwean products/suppliers, price/availability/market transparency, diaspora access to verified local commerce, better market/local-authority information, digital skills/Commerce Academy, export-ready supplier discovery, commerce-continuity information during shortages/disruption. Safeguards: political neutrality and no political ads initial platform, no exclusive government data access/ownership/privileged data lane, no government/sponsor ranking privilege in organic search, no surveillance backdoor/repurposing buyer behaviour for political profiling, no exclusive procurement preference implied, aggregate public reporting not personal surveillance, documented lawful-access process, independent correction/appeal/transparency reporting, public methodology for impact metrics, separation commercial/regulatory/public-interest data products. Independent Impact Scorecard and briefing pack: primary national-scale artifact is independently auditable Impact Scorecard not request for endorsement reporting active/retained MSMEs digitised, fresh local offers/coverage cells, % covered searches resolved with confirmed stock/credible request response, merchant advertising-wallet share/net local advertising value retained, creator/agent/market income, buyer response/complaint/trust outcomes, geographic/language inclusion, privacy/correction/transparency indicators. Briefing pack may include two-page impact case, live merchant/buyer/creator demonstration, 100-day scorecard, privacy/governance note, partnership menu, local-value-retention methodology, clear evidence boundaries. Usable by investors/DFIs/associations/municipalities/regulators/ministries/national leadership without promising political patronage/exclusive access.

29. Risk Register and Decision Gates

Risk register and decision gates content as binding.

30. Final Business Model and Immediate Actions

Final model: Shoppage is Zimbabwe independent preloaded commerce operating system: one public product for selling/discovering/growing, launched with million-plus master catalogue, claim-ready national organisation/place graph, known markets, historical intelligence, cold-start recommendations, structured Request Network, continuously converted into fresh merchant-owned offers and verified commercial truth. Durable advantage combination: authoritative merchant operations, fresh local offers, structured product/variant intelligence, place/market relationships, buyer needs/unresolved demand, trust/outcome history, attributable

creator/advertising data, payments/fulfilment evidence, reusable platform infrastructure. Immediate executive actions: Approve v1.1.1 as binding master and archive v0.7-v1.1 as source/review/consolidation history, Confirm Home/Power/Building Harare wedge, Appoint owners for product/technology/commerce data/field activation/trust/commercial partnerships, Complete brand/domain/company/trademark due diligence, Complete Zimbabwe legal review for data/consumer/payments/ads/creators/tax/fulfilment, Select/contract pilot payment/fulfilment partners, Recruit first merchant/fixed-bounty creator/market cohort, Run no-empty-platform/social-adaptor-disabled/source-removal/cold-start recommendation acceptance suites before public launch, Convert validated intelligence package into production PostgreSQL services/review queues, Lock 12-week backlog and exclusions, Establish weekly scorecard/evidence register/capital budget.

29. Risk Register and Decision Gates — Detailed

Risk	Primary Mitigation	Stop/Escalation Gate
Platform scope exceeds capacity	Harare wedge, explicit exclusions, weekly targets	Repeat targets before removing controls
Stale/false inventory destruction	Enforce SLA, downgrade/hide, correct feeds	Suspension/visibility for repeat failure
Merchant activation labour	Assisted tools, distributor feeds, agent network	Report on narrow cohort if activation cost unsustainable
Buyer demand insufficient	Requests, creator distribution, SEO, marketing	Deny Q1 scale ad sales without organic resolution
Ads harm relevance	Eligibility floors, independent integrity	Pause product/advertiser on breach
Fraud/scams	Progressive verification, anomaly detection	Category/merchant suspension + appeal
Payment liability confusion	Provider-hosted processing, clear merchant terms	Disable provider/flow until reconciliation reliable
Fulfilment failure	Mode-specific evidence, partner performance	Remove unreliable partner/area
Data-rights breach	Source inventory, licences, access controls	Quarantine dataset, notify stakeholders
AI publishes unverified truth	Draft-only controls, evaluation	Rollback model/feature
Pemosites becomes agency	Standard templates, spinout gates, deferred payment	Stop work not productisable
Framework opens too early	Internal-first APIs, private beta	No public ecosystem until security/reliability gates pass
Subsidiary proliferation	Admission tests, separate P&Ls	Board rejects unfunded/unproven venture
Political capture/endorsement	Neutral governance, Impact Scorecard, Decentralised access	Decline privileged access/monitoring independence
External-platform dependence	Canonical identity/content/demand, adaptable	Plan kill-switch, test immediate if core depends
Creator commission fraud	Fixed launch bounties, staged attribution	Disputeable commissions until gates pass
Infrastructure cost/lock-in	Adapters, budgets, export tests	Migrate/redesign before scale

Binding decision gates: Launch gate (end-to-end flows, security, data rights, support, minimum useful supply), Ads scale gate (repeat organic demand, attributable outcomes), Transaction-depth gate (payment/fulfilment reconciliation/dispute capacity), City gate (coverage, owner, demand, partners, budget), Category gate (taxonomy, safety, supply, fulfilment), API gate (stable contracts, consent, audit, revocation), Subsidiary gate (demand, economics, leadership, risk), Capital gate (milestones, unit-economics evidence).

Appendix A: Prioritised 95-Aim Portfolio

Aims classified Launch (0-3), Expansion (4-6), Later (>6). Every aim requires owner/proof metric before sprint. Examples: Become default local product-search habit in covered categories (Expansion, repeat direct search/unaided recall), Capture measurable merchant ad wallet share (Expansion, % attributable spend moved), Retain more advertising value locally (Expansion, net local value-retention ratio), Operate independently while using external as optional feeders (Launch, kill-switch pass + owned-demand share), Own commercial intent category by category (Launch, resolved-need share), Build Zimbabwean commercial keyword intelligence (Launch, query success/synonym coverage), Establish transparent local ad standard (Launch, comprehension/complaint rate), Resolve needs faster than social-group posting (Launch, median time

to credible option), Show stock confidence instead of false certainty (Launch, freshness visibility/error reports), Support exact variant discovery (Launch, variant match/correction), Provide useful price intelligence (Expansion, coverage/alert usefulness), Offer available-today discovery (Launch, same-day actions), Automate saved needs (Expansion, alert-to-action), Route buyer requests (Launch, response/fill rate), Support voice-first search (Expansion), Support English/Shona/Ndebele progressively (Expansion), Design for low data/unstable networks (Launch, data budget/completion), Compare total buyer outcome (Expansion), Give every merchant credible mobile storefront (Launch, activated Merchant Sites), Reduce publishing time via assisted ingestion (Launch, median time to publish), Turn every product into reusable content (Launch, assets per offer), Create daily merchant action queue (Launch, completion/freshness improvement), Measure lead quality not volume (Launch, accepted qualified-action rate), Preserve customer relationship history (Launch, follow-up/repeat rate), Deliver actionable analytics (Launch, recommended-action completion), Add inventory/POS integrations (Expansion), Build merchant team/branch management (Expansion), Create merchant benchmarks (Expansion), Build canonical product/variant graph (Launch), Capture branch-level local offers (Launch), Maintain evidence/provenance (Launch), Maintain correction/review queues (Launch), Separate candidates from verified production truth (Launch), Build coverage cells (Launch), Map compatibility/substitution (Expansion), Capture unmet demand (Launch), Build price/availability history (Expansion), Build merchant/market performance history (Expansion), Create Zimbabwe business knowledge layer (Launch), Create correction/verification networks (Expansion), Protect graph from scraping/poisoning (Launch), Monetise aggregate intelligence without personal-data sale (Later), Make self-service advertising understandable (Launch), Guarantee relevance floors for sponsored (Launch), Measure creator links without tying launch pay to fragile attribution (Launch), Build creator marketplace matching (Expansion), Pay creators via bounties first then verified outcomes (Launch), Build local creative intelligence (Expansion), Launch market/area sponsorships (Expansion), Enable brand-to-stockist campaigns (Expansion), Use controlled ad credits (Expansion), Build campaign experiments (Expansion), Establish independent ad integrity (Launch), Digitise markets as operating units (Launch), Create Market Captain roles (Launch), Deploy QR infrastructure (Launch), Map commercial corridors/informal landmarks (Expansion), Build verified collection points (Expansion), Promote market events/live discovery (Expansion), Replicate province by province using gates (Later), Build progressive verification (Launch), Use proof-backed reviews (Expansion), Detect suspicious pricing/scam content (Launch), Create category-specific safety policies (Launch), Support realistic payment paths (Launch), Add buyer protection gradually (Later), Integrate delivery as quoted network (Launch), Measure fulfilment reliability (Expansion), Set international performance budgets (Launch), Build accessible interfaces (Expansion), Use modular shared platform (Launch), Maintain provider/social-channel portability (Launch), Create AI evaluation harness (Launch), Keep humans in high-impact decisions (Launch), Use AI to reduce cost not conceal weak ops (Launch), Run continuous competitor response (Expansion), Build observability day one (Launch), Treat security/privacy as product quality (Launch), Launch with 1M+ masters (Launch), Load $\geq 10k$ claim-ready org profiles (Launch), Make every preloaded merchant claimable (Launch), Maintain national place/known-market breadth (Launch), Separate reference from local offers visibly (Launch), Build Historical Commerce Archive (Launch/Expansion), Ingest collaborator/purchased data safely (Launch), Deploy cold-start recommendations before behavioural scale (Launch), Build Local Commerce Intelligence Model (Expansion), Preserve removal/correction through derived models (Launch), Measure merchant-profile claim conversion (Launch), Build compatibility/substitution intelligence (Launch/Expansion), Avoid single-source dependence (Launch), Use AI to enrich at scale without inventing facts (Launch), Maintain manual fallback for every mission-critical flow (Launch).

Appendix B: Strategic Extension Portfolio

Merchant infrastructure: Pemosites, POS/stock sync, digital catalogue/QR ordering, branch/franchise tools, CRM, quotations/invoices, bookings, content services, data migration, Business Improvement Copilot. Commerce networks: B2B procurement, distributor portals, construction/installer network, agricultural commerce, local services, logistics/collection exchange, diaspora procurement, export-ready suppliers, Made in Zimbabwe, repair/compatibility network. Physical markets: Market digital twins, stall/tenant tools, market advertising, events, visitor/demand analytics, collection coordination, loyalty/offers, shopping trails, municipal dashboards, vacancy/merchant-mix intelligence. Media/advertising: Partner-publisher inventory, creator

storefronts, live shopping, deal alerts, sponsored requests, brand/distributor campaigns, area sponsorships, product launches, content-production network, privacy-safe retail-media measurement. Intelligence: Price/availability, demand gaps, merchant benchmarking, site selection, substitution/compatibility, brand distribution, informal-cluster mapping, consumer needs, supply-chain performance, public-value measurement. Platform/developer: Commerce APIs, embeddable widgets, payment/fulfilment adapters, themes/plugins, POS/ERP connectors, white-label deployments, identity services, trust APIs, product resolution, approved AI commerce tools. Scored on user pain, strategic fit, data contribution, revenue, capital intensity, regulatory risk, execution capacity, reuse of core.

Appendix C: Core Data Entities and Events

Core entities: Person/user/role/consent, organisation/legal entity/merchant/branch, place/market/building/section/stall/service area, category/master product/variant/compatibility/service, merchant product/offer/price/inventory observation/promotion, media asset/clip/collection/content right, creator/affiliate agreement/attribution link, search/saved need/request/lead/quote/reservation, campaign/placement/spend/ad credit/outcome, payment intent/provider event/reconciliation/refund state, fulfilment quote/provider/milestone/proof, verification/complaint/review/dispute/appeal, source/evidence/licence/confidence/review/supersession, plan/entitlement/invoice/partner app/API credential. Minimum event standard: event name, actor, organisation, object, session, timestamp, source surface, location precision, campaign/creator attribution, consent context, relevant outcome state. Sensitive values not in analytics when reference identifier sufficient.

Appendix D: Source and Evidence Notes

1. U.S. International Trade Administration Zimbabwe eCommerce updated March 2026: social-media-led, Facebook Marketplace/WhatsApp, cash on delivery/mobile payments. 2. DataReportal Digital 2026 Zimbabwe: late-2025 mobile connections, internet users, social identities. 3. UNCTAD Zimbabwe eTrade Readiness Assessment: urban/informal/diaspora-driven, logistics, pickup-centre, legal/skills gaps. 4. Zimswitch official site: Zimswitch Online, recurring payment, national-switch positioning. 5. Paynow official site: merchant services/e-commerce payment solutions. 6. POTRAZ official site: Data Protection Authority, Cyber and Data Protection Act guidance. 7. Classifieds.co.zw public site: broad categories, USD/ZiG display, free-ad functionality. 8. Ownai public site: multi-category catalogue/cart/wish list/compare. 9. Hypermarket public site: multi-vendor positioning, trusted-vendor claims, Paynow checkout. 10. Shoppage Commerce Intelligence Foundation v0.4 and Implementation Progress Report 10 July 2026. 11. Google Merchant Center local inventory, YouTube Shopping affiliate, TikTok Shop affiliate docs as global pattern references not Zimbabwe availability claims. 12. Cloudflare Stream, Mux, Supabase docs as technical options subject to cost/rights/portability review.

Appendix E: Holistic Review Summary

v0.7 contained strong strategic material but append-only structure created investor/implementation risk: repeated executive/final-decision statements, four overlapping roadmaps, repeated AI/investor/risk/security/architecture sections, unqualified national/complete/fully functional language, possible confusion between global product references and Zimbabwe offers, launch-wedge mismatch with food-product seed, unclear early ad-market cold-start economics, payment/fulfilment ownership ambiguity, merchant-site/Pemosites overlap, platform-ecosystem ambition opening too early, 80 aims/60 opportunities without horizon separation, accessibility metadata gaps, excessive direct formatting/non-semantic headings, raw URL citation labels, need to date/qualify statistics/competitor features. v0.8 consolidation resolved. v0.9 adversarial pass made platform independence testable, simplified external brand language, staged creator compensation realistically, removed endorsement-dependent wording. v1.0 locked preloaded-intelligence launch, merchant claiming, historical archive, local recommendation model, mission-critical execution doctrine. v1.1 converted review into binding execution controls: four pre-gates, unclaimed policy with SLA, rights register before indexing, reference library vs local search separation, wedge corpus 20k+, deterministic/hybrid recommendations with learning gate, Pemosites deferred beyond month 6, freshness auto-hide/ranking/ad

eligibility, Facebook/manual export/authorised-import without critical dependency, pricing simplified Free + Growth Pilot, verification predicate-specific/budgeted, reference/unclaimed excluded from active KPIs. v1.1.1 implements full liability-controlled execution master same structure/length as v1.1, with exact public copy, coverage-cell commercial contract, independence kill-switch acceptance, creator-bounty SOP, source-rights service spec.

Appendix F: Mandatory Pre-Public-Launch Gates

Gate 1 Source-Rights: rights register 100% for launch inventories, ODbL review completed, legal sign-off, deletion-propagation tested, quarantine path operational, no blank permission interpreted as permission, default BLOCKED. Gate 2 Field-Economics: 30 pilot merchants activated manually, time-to-publish, CAC, activation cost, freshness maintenance cost measured, payback model <60 days for Growth Pilot, field agent/captain productivity metrics. Gate 3 Native-Demand Superiority: median time to credible option < Facebook group post, Request response >60% in Usable cells, QR funnel measured, Owned Demand Share rising, saved needs/alerts functional. Gate 4 Security/Privacy/Rights: POTRAZ checklist completed, privacy notices/DSAR workflows published, pen test no critical, backup/restore drill passed, source-removal propagation test passed, audit logs operational, incident/complaint/manual fallback playbooks ready.

Appendix G: Source-Rights Register Specification

Operational register maintained in workbook + production service. Minimum fields: Identity: Source ID, owner, dataset, version, hash, URL/reference; Acquisition: Method, date, source class, collector, automation/manual; Rights: Licence/contract, evidence link, public display, indexing, derived claims, analytics, redistribution, AI training, media use; Personal data: Classification, lawful basis, sensitive/minor flags, jurisdiction; Obligations: Attribution, share-alike, field restrictions, retention, expiry; Operations: Refresh cadence, correction channel, takedown SLA, deletion-propagation plan; Governance: Owner, legal review, status, next review date, residual risk. No blank permission is permission. Default BLOCKED until approved. Source-rights service enforces at indexing/search/recommendation/API layers.

Appendix H: Unclaimed-Profile Policy and Public Copy

H.1 Public banner exact: Unclaimed reference profile. This page was assembled from the dated public or licensed sources shown below and is not currently managed by the business. Information may be incomplete or outdated. Claim this business or request a correction/removal. H.2 Display restrictions: no active seller/verified merchant/stock/price/payment/fulfilment claims without current evidence, no merchant marketing language attributed, no paid ads/lead charges against unclaimed, personal mobile numbers/residential addresses heightened review/suppressed, disputed material fields suppressed within 24h SLA. H.3 SLA: immediate acknowledgement/case number, within 24h correct or temporarily suppress materially harmful/identity-sensitive disputed fields, within 3 business days ordinary evidence-based correction target, complex ownership disputes status update every 3 business days, appeal/audit history retained.

Appendix I: Coverage-Cell and Native-Demand Test Standard

Coverage cell is category x geography x fulfilment mode. State Seeded: reference taxonomy/profile only, Reference Library + Request Network, no ads. Usable: 3 claimed merchants, 50 fresh offers, >60% response within agreed window, public category discovery, limited managed campaigns. Strong: 10 claimed merchants, 250 fresh offers, >75% response, 30 resolved needs, self-service ads and stronger recommendations. Defensible: repeat direct demand, merchant retention, price/stock history, creator/market distribution, expansion/investor proof. No cell may be called covered from reference records alone. Native-demand tests: fresh local offers and Request Network acceptance, median time to credible option vs Facebook group, request response/fill rate, owned-demand share vs external-platform concentration, QR sessions/attribution actions, saved needs/alert-to-action conversion.

Appendix J: Independence Kill-Switch Acceptance Tests

Minimum staging tests: 1 Disable Facebook/WhatsApp/TikTok/Google adapters via feature flags. 2 Create/recover buyer account using Shoppage-owned identity. 3 Claim organisation and complete ordinary ownership review. 4 Publish product and fresh local offer. 5 Search and filter local offers. 6 Submit buyer request and route to eligible merchants. 7 Record merchant response and buyer contact/lead. 8 Correct/suppress unclaimed profile. 9 Export social card and canonical link without API dependency. 10 Queue offline merchant draft and sync safely. 11 Export merchant-managed data. 12 Re-enable adapters without duplicate events or data corruption. Any failure of steps 2-8 blocks public launch.

Appendix K: Creator-Bounty Operating Procedure

K.1 Launch compensation: fixed fee per accepted deliverable, written brief/merchant consent/disclosure copy, canonical Shoppage link required, content remains live for contracted period, verification after 48h, payout through approved rail after acceptance, fraud/duplicate/complaint checks. K.2 Minimum manual evidence before commission code: ≥ 20 accepted/paid bounties, verified click/lead instrumentation stable, duplicate-phone/self-referral controls tested, merchant outcome marking quality measured, dispute/payout procedures completed. Bounty packages example: one catalogue-linked video, defined number compliant community posts, merchant onboarding, market walk-through, product-data capture assignment.

Appendix L: v1.1.1 Engineering Backlog and Kill List

P0 Backlog: source-rights service + source partitioning, deletion propagation/quarantine, unclaimed-profile policy UI + SLA queue, claim/correction/suppression/duplicate workflows, local-offer freshness auto-hide + ad eligibility, coverage-cell computation, Request Network + routing, social export-card generator, independence feature flags + acceptance suite, rules/hybrid recommendation + evaluation harness, board metric separation for reference/claimed/activated/fresh supply. Kill List for months 0-6: Pemosites/bespoke websites, public plugin marketplace/unrestricted APIs, owned fleet/warehouse/wallet, creator outcome commissions before gates, behavioural personalisation before evidence threshold, default buyer search dominated by reference-only products, unauthorised social scraping, field verification claims across all preloaded profiles, multi-tier subscription complexity, city/category expansion before strong coverage cells.

End of Shoppage National Commerce Model v1.1.1 — Liability-Controlled Preloaded Intelligence and Execution-Gate Edition. Binding interpretation: must/will/non-negotiable = decision. target/hypothesis/candidate/pilot/later = requires validation. Reference scale front-loaded asset; commercial success measured by claimed profiles, fresh offers, resolved needs, repeat direct use, merchant economics, revenue. No blank permission is permission. Default BLOCKED. No cell called covered from reference alone. No ads sold below usable. Core flows must pass with all adapters disabled.
